

# Database Administration

## Laboratory

### Part 2. Operation on data in MySQL database

*Most activities assisted by MySQL Workbench.*

Please attach screenshots, issued statements, and produced files as parts of a project documentation.

#### 1. Database synchronization

- a) Synchronize database model from MySQL Workbench to empty database schema (change schema name in model to fit the database).
- b) Export changes from database model to database schema containing tables.
- c) Import changes from a database schema to the existing database model.
- d) Synchronize changes in the model and database in both directions at once.
- e) Create a new database model basing on existing database schema already containing tables.

#### 2. Filling database tables with data – 2-3 rows in each table

- a) Manipulate data by the means of insert/update/delete SQL statements. All insert statements should be put into the documentation. Please give just a few examples of update and delete statements.
- b) Try to add/remove/update a record using the table view in MySQL Workbench. Put 1 screenshot of each activity into the documentation.

#### 3. Generating DDL script

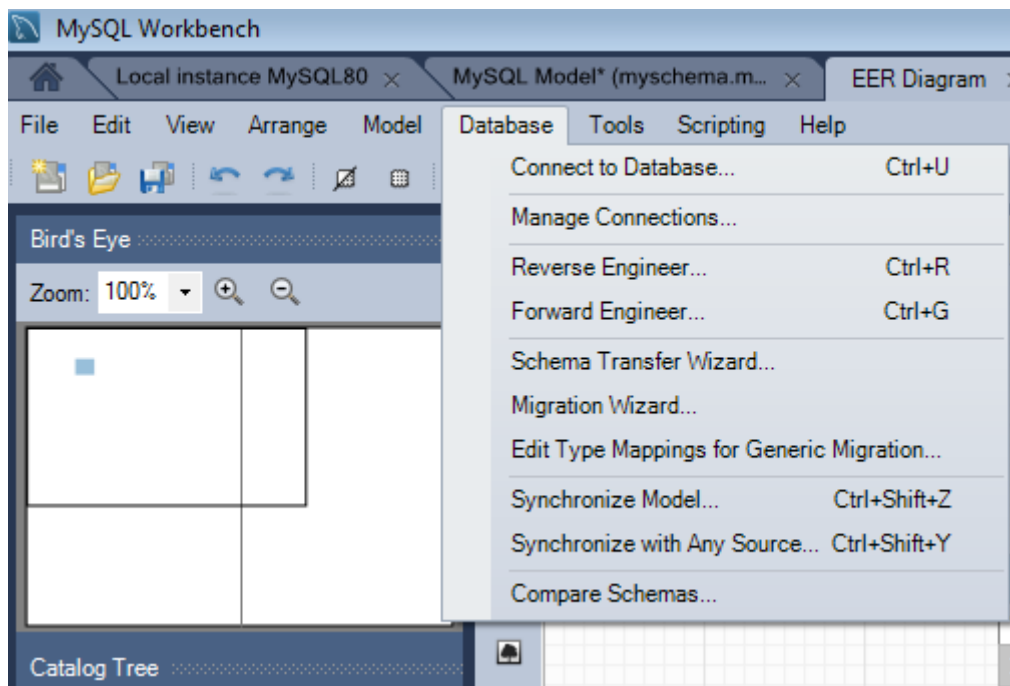

- a) Generate DDL script based on a database model. Attach the script as part of documentation.
- b) Generate DDL script based on a database schema. Attach the script as part of documentation.

#### 4. Exporting and importing data as files

- a) Export and import data (only data), to/from files, from chosen database tables. Use MySQL Workbench options.
- b) Export data from a single table using *select into outfile* statement.
- c) Export data returned by a SQL query joining many tables to a file using *select into outfile* statement.
- d) Import data from a file to a single database table using *load data* statement.

#### 5. Database dumps (data and definition of database objects)

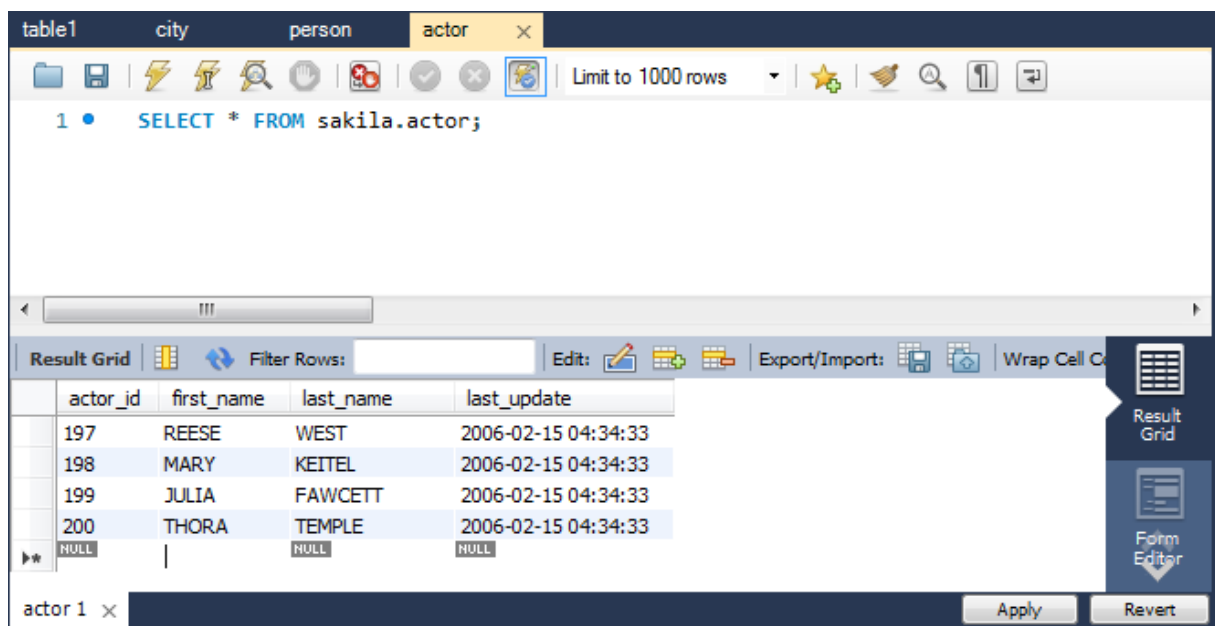

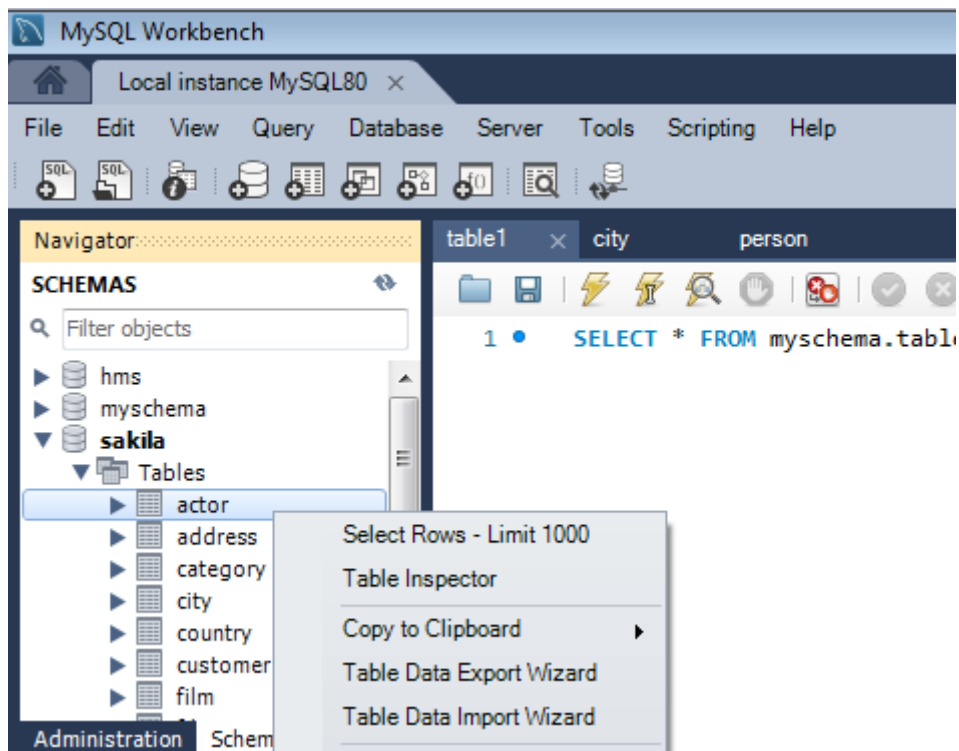

- a) Make the whole database copy (dump) using MySQL Workbench options.
- b) Make the whole database copy (dump) using mysqldump tool and operating system command line.
- c) Restore a database basing on a database dump.
